Formal Review Request Template

Requester: Jack Dimento_____ **Date:** __11/1/2026_____
Reviewer: Hiram Zaldana_____ **Approx. review duration:** _1 hour__

Choose **one primary review method**:

Code / Software Review

Code Quality Review
Inspect the code for issues such as readability, modularity, maintainability, efficiency, and appropriate programming practices.
White-Box / Edge-Case Testing
Inspect the internal logic and systematically test branches, boundary conditions, exceptions, or adversarial inputs.
Black-Box / Functional Testing
Develop test cases from the expected requirements or behavior and determine whether the software produces the expected results.
Performance / Runtime Testing
Systematically evaluate whether the software meets relevant runtime or performance expectations.

Usability Review

- **Task-Based Usability Testing**
  Give the reviewer/user specific tasks to complete while you observe what they do, where they succeed, and where they encounter problems. A think-aloud protocol may be used.
- **Heuristic / Guidelines Evaluation**
  Systematically inspect the interface using identified usability principles, heuristics, or design guidelines.
- **Prototype Usability Testing**
  Have users complete defined tasks using a wireframe, prototype, or partially implemented interface.

Design Review

- **Architecture / Conceptual Design Review**
  Evaluate whether architecture and major design decisions align with project requirements and constraints.
- **Preliminary Design / UML Review**
  Evaluate proposed system structure, diagrams, component relationships, interfaces, or other design artifacts.
- **Security Design Review**
  Evaluate relevant authentication flows, trust boundaries, data protection, error handling, or other security-related design decisions.

Other

- **Other review method:**
  _____
  _____

Explain what the reviewer will evaluate and why this method is appropriate for your work:

The reviewer will be given our brief and wireframes and make sure that we are going about our planning the right way.

Review Request Details

1) What specifically should the reviewer examine or interact with?
   Specifically, he should be looking at the brief and our wireframes, looking to make sure we have everything our sponsor is requesting.

---

2) What question do you want this review to help answer?
   Are our wireframes sufficient for us to start building our project around.

Examples:

- Does this implementation correctly handle boundary and error cases?
- Can a new user complete the checkout task without assistance?
- Does this architecture satisfy our project's stated requirements?

---

3) What should the reviewer focus on?
   The reviewer should focus on making sure our wireframes cover everything asked for by our sponsor and flow well.

---

4) What should the reviewer *not* evaluate during this review?
   The reviewer should not evaluate if our wireframe buttons actually work etc.

Examples:

- Do not evaluate visual polish or mobile responsiveness (for a usability test evaluating navigation and task completion)
- Do not evaluate the database layer or unfinished API integration (for a code review focusing on the authentication module)

---

5) What should the reviewer use to judge the work?
   Coding/design best practices and the brief given by the sponsor.

Examples include expected software behavior, project requirements, coding best practices, usability heuristics, or design constraints.

Reviewer Section

1) Briefly describe what you actually did during the review.

Examples include executing defined test cases, inspecting particular code paths, observing a user completing defined tasks, or systematically examining a design against specified criteria.

I reviewed the four provided wireframes and compared them against the requirements outlined in the OblyssPro Capstone Project Brief. I focused on whether the proposed designs adequately covered the sponsor's expectations for the owner's first-login questionnaire, setup dashboard, task assignment and hand-off process, and technician onboarding experience. I also evaluated the overall organization, navigation flow, clarity of instructions, and ease of use from the perspective of the intended users. Throughout the review, I identified strengths and potential areas for improvement, particularly regarding missing or unclear design elements.

---

2) What portions of the artifact did you evaluate?

I evaluated all four provided wireframes:

1. **Owner First Login: Reviewed the initial questionnaire, its questions, instructions, and options for skipping or continuing the setup process.**
2. **Setup Dashboard: Examined the organization of setup phases, task descriptions, progress tracking, estimated completion times, assigned users, and task statuses.**
3. **Task Details and Hand-off: Reviewed how task prerequisites, completion requirements, assigned team members, and task instructions are presented.**
4. **Technician First Run: Examined the technician's assigned tasks, recommended first actions, role-specific information, and navigation.**

I focused primarily on whether these components aligned with the sponsor's requirements and provided a clear, understandable experience for their intended users.

---

3) Provide or link to relevant evidence such as test cases, screenshots, notes, annotated code, observations, or other review artifacts.

The review was based on the four wireframes provided by the team and the requirements outlined in the OblyssPro Guided Setup: Capstone Project Brief.
The following observations were recorded:

1. **Owner First Login: The questionnaire includes relevant business questions and an option to skip. However, the purpose of each question and how the answers influence the setup plan could be communicated more clearly.**
2. **Setup Dashboard: The dashboard provides a clear overview of setup phases, task progress, estimated completion times, and assigned team members. However,**

certain actions and task statuses specified in the sponsor's requirements are not yet represented.

3. **Task Details and Hand-off: The task details screen clearly communicates prerequisites and completion requirements. However, the proposed hand-off process does not yet demonstrate recommended assignees, permission handling, or other assignment options.**
4. **Technician First Run: The technician dashboard appropriately separates employee responsibilities from business setup. However, the wireframe does not fully demonstrate the three-to-five-screen onboarding experience requested by the sponsor.**

The four wireframe screenshots serve as visual evidence for these observations. The sponsor's project brief was used as the primary reference for evaluating requirement coverage.

Findings

Strengths:

- **Clear organization and navigation: The setup dashboard organizes tasks into distinct phases, displays progress, and provides estimated completion times. This makes it easier for users to understand what has been completed and what still needs attention.**

- **Effective communication of task requirements: The task details screen clearly identifies incomplete prerequisites, explains why certain tasks cannot be completed, and provides instructions for proceeding. This helps prevent confusion and guides users through the setup process.**

- **Appropriate separation of user responsibilities: The wireframes distinguish between the business owner's setup responsibilities and the technician's assigned tasks. This supports the sponsor's goal of providing a role-specific experience without overwhelming employees with unnecessary information.**

Issues / Defects:

Description of Issue	Severity (Low/Med/High)	Evidence / Example	Suggestions
Incomplete Hand-off Workflow	High	The Task Details wireframe includes an assigned team member dropdown,	Expand the hand-off wireframe to illustrate how

		but it does not clearly demonstrate recommended assignees, permission checks, or the process for handing off an entire setup area.	users select recommended team members, assign responsibilities, and handle permission restrictions. This would help ensure the design addresses the sponsor's requirements before implementation.
Incomplete Technician Onboarding	High	The Technician First Run wireframe displays assigned tasks and recommended actions but does not demonstrate the three-to-five-screen onboarding sequence described in the sponsor's brief.	Include additional wireframes showing the technician's initial profile setup, notification preferences, daily responsibilities, and available help resources. The design should also demonstrate how users can skip or revisit onboarding.
Unclear Questionnaire	Medium	The Owner First Login wireframe	Add a brief explanation

Customization		includes relevant questions, but it does not clearly explain why each question is asked or demonstrate how the answers affect the resulting setup plan.	beneath each question and illustrate how different responses customize the setup tasks presented to the owner.
Missing Setup Task Actions and Statuses	Medium	The Setup Dashboard displays task progress and includes a View action, but it does not clearly demonstrate the required Skip for now option or all seven task statuses specified in the sponsor's brief.	Clarify where users can skip individual tasks and how statuses such as Assigned, Skipped, Needs attention, and Not needed will be represented.

Requester Follow-Up

1) How will you address the feedback? If you decide **not** to, briefly explain why.
